Content types

The administration tool or Back Office allows to feed the content without worrying about technical aspects. Three categories of content can be used to define the navigation tree within the application :

- **Containers** : allow to group together a set of content. They represent branches in the navigation of the application. A container can visualize its child data in different forms: list, banner, grid, etc.
- **Content pages** : these are screens displaying information. A content page is an end point of a navigation branch. Depending on the type, content pages offer a display and operation adapted to the specific data.
- **Functions** : Each has a specific role such as logging in, viewing my favourites, launching a form, etc.

For each content, you will find a detailed description and a tutorial video.
