Containers

Containers are used to group together a set of contents. They represent branches in the navigation of the application. A container can visualize its child data in different forms: list, banner, grid, etc. 4 types of containers exist :

- **Folder** : the most used container, allows to display its children in 7 different forms
- **Google Map** : to display location-based data
- **List / Map** : to display geolocated data
- **Product category** : to display all the products of a category
